Incident Report Q1 2024

Summary

Three incidents were recorded in the first quarter of 2024. The largest was a database outage on January 14 that lasted four hours and blocked all write operations.

Incident table

ID	Date	Service	Minutes	Root cause
INC-101	2024-01-14	Database	240	Disk full
INC-102	2024-02-02	Payments	95	Connection pool exhaustion
INC-103	2024-03-03	Auth	30	Expired TLS certificate

Narrative

The January 14 database outage happened because the primary volume reached 100 percent capacity. No disk usage alert existed at the time. The February 2 payments incident was caused by exhaustion of the database connection pool under peak load. The March 3 authentication incident was caused by an expired TLS certificate that nobody was assigned to renew.

Postmortem actions

- Add disk usage alerts at 80 percent capacity.
- Assign an owner for certificate renewals.
- Raise the payments connection pool size.
