Incident Report Q2 2024

Summary

Three incidents were recorded in the second quarter of 2024. A second disk-full database outage occurred on May 21.

Incident table

ID	Date	Service	Minutes	Root cause
INC-201	2024-04-09	API gateway	60	Misconfigured rate limit
INC-202	2024-05-21	Database	180	Disk full
INC-203	2024-06-12	Checkout	45	Connection pool exhaustion

Narrative

The April 9 API gateway incident was caused by a misconfigured rate limit that rejected legitimate traffic. The May 21 database outage repeated the root cause of the January outage: the volume filled up and writes failed. The June 12 checkout incident was again caused by connection pool exhaustion.

Postmortem actions

- Automate database volume expansion.
- Review rate limit changes before deployment.
- Run quarterly failover drills.
